

In today's information-rich business environment, it has become critical for organizations to manage employee communications, both from a productivity, business continuity, and intellectual property standpoint, as well as from a regulatory, HR, and legal discovery perspective.

IntelliReach mx2020™ is a policy-based messaging management solution that integrates archiving, compliance, discovery, secure messaging and filtering, enabling IT professionals to manage their messaging systems with a single solution.

## Integrated Messaging Management

IntelliReach mx2020's integrated policy management provides organizations with one place to control messages by defining what to keep out, what to secure, and what to store.

For example, an organization may have a Hygiene Policy to check messages for viruses and blocked senders, as well as an Archiving Policy that contains different rules pertaining to retention and storage of messages and attachments. These policies enable the organization to selectively filter out unwanted or inappropriate messages, while also choosing which messages are archived, where they are stored, and for how long.

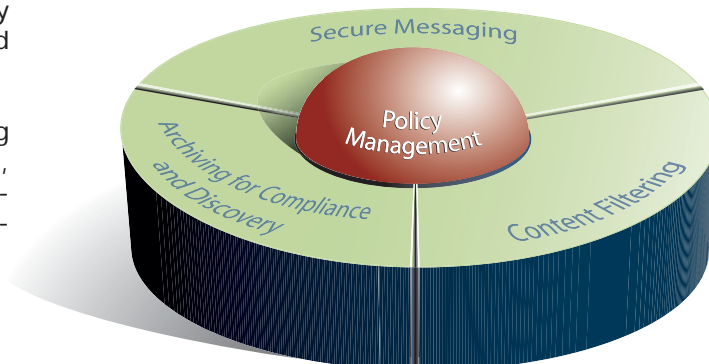

Policies use conditions that are based on sophisticated content analysis, type of sender or recipient, and dozens of other factors—all configurable by IT and others who are given permissions.

Dozens of policies related to filtering, secure messaging, archiving, compliance and discovery are provided with the system out-of-the-box, enabling rapid deployment.

Good policy management means that rules can be put in place and adjusted through time to reflect the requirements of new regulations and changing business practices.

## Incredible Control

IntelliReach mx2020 gives IT professionals incredible control of the messaging environment—from a single Web-based interface. The administrator's dashboard monitors all facets of the messaging environment, including at-a-glance information on quarantines, investigations, archives and storage.

**Policies manage all aspects of the messaging environment, integrating filtering, archiving, compliance, discovery and secure messaging.**

Unique features of IntelliReach mx2020 include:

- Comprehensive integration of filtering, secure messaging, archiving, compliance and electronic discovery
- Visual policy editor and workflow
- Flexible roles and permissions
- Ability for non-IT staff to create and enforce policies related to email
- Fast search across all storage media

## Visual Policy Editing and Workflow

IntelliReach mx2020 represents policies with a unique visual approach, using workflow diagrams to make policy creation and management simple and straightforward. In addition to viewing policy by workflow, IT and others with permissions can also view policy by hierarchy. Policies can easily be created by user group (e.g., Sales) or by message flow—inbound, outbound or internal.

## Multiple Roles

Policy creation and management isn't limited to the IT group. A Policy Administrator role can be assigned to selected users in the organization, offloading some of the policy responsibilities to Legal, Human Resources or Compliance personnel.

In addition to the Policy Administrator role, the system also provides several other useful roles out-of-the-box to enable compliance reviews and electronic discovery. Even non-employees, such as outside counsel, can access the system via the External User role.

## Flexible Permissions

The system also enables IT professionals to select which permissions to give each user or group of users. For example, members of the Sales department may have the ability to change the parameters of their spam detection, while the rest of the organization isn't permitted to make any modifications.

## Sophisticated Search

IntelliReach's unique architecture builds search into the core of the system. Text search across the entire archive, including all storage media, is possible due to the unique, persistent, full-text index and IntelliReach's patent-pending technology.

## IntelliReach mx2020 Functionality

IntelliReach's next-generation messaging system integrates all applications of the messaging environment:

**Archiving.** Single instance storage, full-text index, and support for all types of storage media

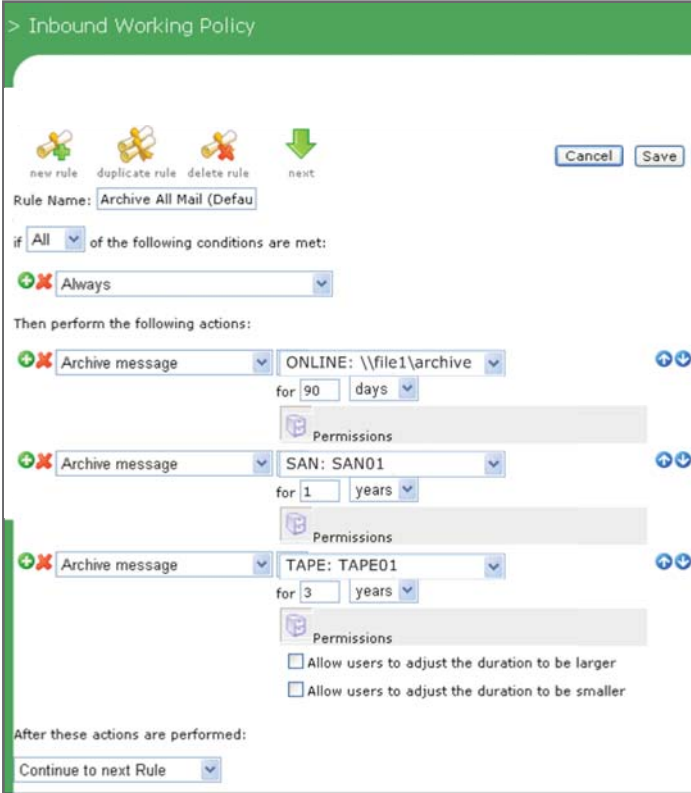

**Compliance.** Out-of-the-box lexicons for content-based analysis, Compliance Review queues and roles, export to multiple formats, and complete audit trail

**Investigations.** Search, review, and classification of messages for electronic discovery

**Secure Messaging.** Content-based or user-enabled secure delivery

**Content Filtering.** Spam and virus filtering and inappropriate email usage monitoring

IntelliReach mx2020 is integrated with Microsoft Exchange/Outlook, Lotus Notes/Domino and Novell GroupWise clients.

IntelliReach enables organizations to create and modify policies that determine which messages to archive, where they are stored, and for how long. Different policies can be created for different users or groups of users.

## About IntelliReach

IntelliReach is the leader in Integrated Messaging Management. The company's uniquely simplified yet powerful approach to message management provides policy-based software that integrates archiving, compliance, discovery, secure messaging and filtering, thereby enabling IT professionals to manage their messaging systems with a single solution. With maximum flexibility in managing messages by policy, and intuitive, role-based user interfaces, IntelliReach reduces IT complexity and eases the burden of security and compliance on the organization. IntelliReach's core technologies reflect the company's seven years of experience developing messaging management software. IntelliReach is privately held and headquartered in Dedham, MA.

**See the Future of Messaging. IntelliReach mx2020.**
